Innovation is Key to Growth

January 14, 2019  |  For Informational Purposes Only
Why Invest in Disruptive Innovation?

ARK believes that disruptive innovation is key to growth. We aim to identify large-scale investment opportunities by focusing on public companies that are the leaders, enablers, and beneficiaries of disruptive innovation.

Opportunities resulting from disruptive innovation are often undiscovered or misunderstood by traditional investment managers who are focused on sectors, indexes, short-term earnings and price movements.

ARK’s research spans across sectors, industries, and markets to gain a deeper understanding of the convergence, market potential, and long-term impact of disruptive innovation.

**Risk of Investing in Disruptive Innovation:** ARK aims to educate investors and to size the potential opportunity of Disruptive Innovation, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk and regulatory risk.
Identifying Investable Innovation Platforms

ARK’s investment process recognizes that true disruptive innovation causes rapid cost declines and demand growth, cuts across sectors and geographies, and spawns further innovation, stimulating growth over extended time horizons.

1. Cost Curve Declines
   - Cost Decline Under Wright’s Law (Including Tipping Point)
   - Percent Change in Costs
   - Cost curve bends as unit demand crosses critical thresholds.
   - Cost declines compound as production growth accelerates.

2. Cross Sector Ramifications
   - Penetration of Electricity by Manufacturing Subsector
   - Within 30 years, electricity penetrated most sectors

3. More Innovation
   - New Innovation and Technologies Thanks to Battery Breakthroughs

Why Now?

According to ARK’s research, the global economy is undergoing the largest technological transformation in history.

Estimated Impact of Innovation Platforms on Economic Activity

Source: ARK Investment Management LLC, 2018 | Forecasts are inherently limited and cannot be relied upon.
Five Multi-Trillion Dollar Innovation Platforms

As Convergence Accelerates, Innovation Advances

ARK identifies five primary innovation platforms causing what could be the most transformative period in history.

We expect that each of these platforms will create multiple trillions in market capitalization over the next decade, enabling further innovation.

• Blockchain Technology
• Genome Sequencing
• Artificial Intelligence
• Robotics
• Energy Storage
ARK researches the universe of innovation platforms and their underlying technologies. On an annual basis we publish research highlighting the technology breakthroughs that we believe will advance significantly over the coming year. Here are our “Big Ideas” for 2019:

1. Deep Learning
2. Digital Wallets
3. Cryptocurrencies
4. Battery Cost Tipping Points
5. Autonomous Taxi Networks
6. Next Gen DNA Sequencing
7. CRISPR For Human Therapeutics
8. Collaborative Robots
9. 3D Printing For End-Use Parts
Deep learning is a form of artificial intelligence inspired by the human brain. With deep learning, machines don’t need a programmer to tell them what to do. Instead, machines use data to train themselves.

ARK believes every industry will be transformed by deep learning.
Deep Learning Is Software That Writes Itself

Traditional software is coded by an army of human programmers. It’s expensive, fragile, and difficult to maintain. Programs work as designed but cannot surpass human performance.

Deep learning is software that’s not ‘written’ but ‘trained’. Humans gather data and create a learning framework. The system learns the right behaviors automatically. Deep learning improves with more data and often exceeds human performance.
Deep Learning Is the Magic Behind Consumer and Enterprise Tech

Each story, photo, and video is custom selected for users using deep learning.

Apple Watch can predict atrial fibrillation, diabetes, and sleep apnea.

The Tesla Model 3’s Autopilot can overtake other vehicles and drive on highways.

Google Translate translates more than 100 billion words per day.

Salesforce’s Einstein makes more than four billion business analytics predictions per day.

Blue River’s smart tractors use computer vision to reduce herbicide use by 90%.

Source: ARK Investment Management LLC, 2018; Information collected from company reports (Facebook, Google, Netflix, Apple, Tesla, Salesforce.com, Blue River Technologies).
Deep Learning Is the Third Wave of “Software Eating the World”

“Software is eating the world”
- Marc Andreessen¹

- The first wave of software on PCs disrupted a handful of industries.
- The Internet wave expanded the reach of software beyond the computer industry, creating new tech giants.
- Deep learning is the third wave of software eating the world. It expands the reach of software into massive industries like healthcare, transportation, and manufacturing.

Example: Deep Learning Eats Retail, a $3 Trillion Market in the US

Old Retail Checkout Experience

Based on ARK’s research, Americans wait 300 million hours per year in checkout lines.

Deep Learning Checkout Experience

Amazon Go uses cameras and sensors which feed into deep learning software to recognize shoppers, to understand when they pick up items or put them back, and to allow them to leave the store without checking out at a cash register. Amazon is planning to open 3,000 stores by 2021.¹

Example: Deep Learning Eats Microprocessors

The boom in deep learning software is fueling demand for deep learning processors. “AI Accelerators” are used in servers to speed up workloads.

ARK estimates AI Accelerator revenue as a percentage of total server revenue could grow from 5% in 2018 to 30% in 2028, creating another $30+ billion opportunity.

The slowdown of Moore’s Law* could mean the end of ‘free’ performance upgrades every two years. As a result, server companies will have to increase investment in computing hardware.

*Gordon Moore’s prediction that the number of transistors on a chip would double every two years.

Forecasts are inherently limited and cannot be relied upon.
Deep Learning Could Create 3x the Value of the Internet.

- The internet captured 15% of the globe's equity market capitalization over 20 years.
- If deep learning were to achieve the same rate of adoption, it would add $30 trillion to global equity market capitalizations in the next 20 years.

Forecasts are inherently limited and cannot be relied upon.
While the US Created the Internet Economy, China Could Spearhead the AI Economy.

**National Mandate**
China has a national mandate to become a leader in AI by 2025.

**Internet Population of 800 Million**
China has three times as many internet users as the US, enabling large scale data collection and training.

**No Privacy Risk**
Chinese users are accustomed to censorship and a lack of privacy, which eases AI deployment and minimizes regulatory risk.

**AI Applications**
The world’s most popular AI application is China’s social video app, Tik Tok, with more than 500 million users.

**AI Chip Design**
China is home to a number of leading AI chip design companies such as Cambricon, which powers Huawei smartphones.

**Semiconductor Fabrication**
China is progressing in chip manufacturing technology. Its domestic 16nm fabs are some of the most advanced in the world.

Source: ARK Investment Management LLC, 2018
Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of Deep Learning, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to Deep Learning, such as:

- Software Industry Risk
- Internet Company Risk
- Semiconductor Company Risk

Software Industry Risk. The software industry can be significantly affected by intense competition, aggressive pricing, technological innovations, and product obsolescence. Companies in the software industry are subject to significant competitive pressures, such as aggressive pricing, new market entrants, competition for market share, short product cycles due to an accelerated rate of technological developments and the potential for limited earnings and/or falling profit margins. These companies also face the risks that new services, equipment or technologies will not be accepted by consumers and businesses or will become rapidly obsolete. These factors can affect the profitability of these companies and, as a result, the value of their securities. Also, patent protection is integral to the success of many companies in this industry, and profitability can be affected materially by, among other things, the cost of obtaining (or failing to obtain) patent approvals, the cost of litigating patent infringement and the loss of patent protection for products (which significantly increases pricing pressures and can materially reduce profitability with respect to such products). In addition, many software companies have limited operating histories. Prices of these companies' securities historically have been more volatile than other securities, especially over the short term. Internet Company Risk. Many Internet-related companies have incurred large losses since their inception and may continue to incur large losses in the hope of capturing market share and generating future revenues. Accordingly, many such companies expect to incur significant operating losses for the foreseeable future, and may never be profitable. The markets in which many Internet companies compete face rapidly evolving industry standards, frequent new service and product announcements, introductions and enhancements, and changing customer demands. The failure of an Internet company to adapt to such changes could have a material adverse effect on the company's business. Semiconductor Company Risk. Competitive pressures may have a significant effect on the financial condition of semiconductor companies and, as product cycles shorten and manufacturing capacity increases, these companies may become increasingly subject to aggressive pricing, which hampers profitability. Reduced demand for end-user products, under-utilization of manufacturing capacity, and other factors could adversely impact the operating results of companies in the semiconductor sector. Semiconductor companies typically face high capital costs and may be heavily dependent on intellectual property rights. The semiconductor sector is highly cyclical, which may cause the operating results of many semiconductor companies to vary significantly. The stock prices of companies in the semiconductor sector have been and likely will continue to be extremely volatile.
Digital Wallets:

Mobile Bank Branches

Digital wallets are transforming more than payments. They are becoming gateways for financial services such as wealth management, insurance, banking, and personal finance.

ARK believes that digital wallets could upend traditional banks within five years.
Digital Wallets Are Becoming Gateways for Financial Services

ARK defines digital wallets as more than applications on a phone with payment capabilities. They are financial ecosystems that enable access to a variety of services including wealth management, insurance, instant payments, and cryptoassets.

- Faster peer-to-peer transfers than checks and wires
- Instantaneous and more accurate credit assessment
- Tailored insurance products
- Easy credit card payments
- Personal finance management, tax planning and financial education
- Efficient movement of funds into savings products
- Integration with various wealth management platforms
- Frictionless access to cryptocurrencies
Digital Wallets Enable Frictionless Value Transfers

Digital wallets are an important step in the evolution of frictionless value transfers, making transactions and exchanges simple and seamless in a user’s everyday life.

1. By the end of 2018, Venmo became the 4th largest manager of customer accounts, trailing only Bank of America, Chase, and Wells Fargo.\(^1\)

2. In August 2018, China tightened wallet regulations by imposing caps on QR code payments.\(^2\)

3. In March 2018, Square Cash App introduced banking services such as direct deposit of paychecks, rewards programs, and debit cards.\(^3\)

---

\(^1\) ARK Investment Management LLC, 2018
Digital Wallets Are Encroaching on Big Banks

Digital wallets are scaling quickly relative to traditional banks. By the end of 2018, Venmo will have the fourth largest customer base, trailing only Wells Fargo, Bank of America and JP Morgan Chase. Square’s Cash App also will be in the top 10.

Top Financial Institutions Ranked by Number of Customer Accounts (2018)

- Wells Fargo
- Bank of America
- JPMorgan Chase
- Venmo
- U.S. Bank
- Citibank
- PNC Bank
- Capital One
- TD Bank
- Square Cash App
- USAA Federal Savings Bank
- BB&T
- Regions Bank
- Suntrust Bank
- Citizens Bank
- Fifth Third Bank
- Huntington National Bank
- Keybank
- Discover Bank
- Optum Bank

#4 Venmo
Up from #7 in 2017 and #12 in 2016

#10 Square
On the rise from #14 in 2017 and #41 in 2016
Digital Wallets Should Upend Traditional Bank Branches

- Traditional banks’ reliance on physical infrastructure pushes customer acquisition costs (CAC) to $350-1,500 per person.
- Digital wallets can acquire customers at just $20 per person, becoming effective channels for banks to engage and retain customers.

Range of Customer Acquisition Costs

<table>
<thead>
<tr>
<th>Service</th>

As Seen in China, Digital Wallets Offer Value Beyond Financial Services

WeChat Pay’s screen highlights how it drives e-commerce and other activities outside of financial services.

52% Screen Space Dedicated to E-commerce and Others
For travel, taxi, shopping, specials, games, group buying and gifting.

48% Screen Space Dedicated to Financial Services
For card repayments, peer-to-peer transfers, utility payments, and wealth management.

China Points the Way to Digital Wallets and Mobile Payments

ARK believes that digital wallets like Alipay and WeChat Pay have revolutionized the delivery of banking products at scale in both rural and urban areas throughout China. Their ease of use and accessibility have caused mobile payments to soar 12-fold to $24 trillion in the three years ended 2018.

Growth of Mobile Payments in China

Sizing the Opportunity

Investors value banks for their core deposits and loan relationships. As shown in the chart, they pay a median market cap of $3,400* per US demand deposit for traditional banks today.

Based on lower customer acquisition costs and more cross-selling opportunities, investors could value digital wallets at a significant premium to traditional banks.

Even if the value of a digital wallet customer were just one third that of a bank customer, digital wallet providers could be worth approximately $1,000 per user, or $200 billion, in 2023, leading to seismic changes in the valuations of digital wallet companies such as Square, PayPal, Amazon, and Apple.

Forecasts are inherently limited and cannot be relied upon.

*The individual median data point was calculated from the market cap of more than 3000 data points.
Sizing the Opportunity

Mobile Value Transfers Could Reach $55 Trillion by 2022.

Forecasts are inherently limited and cannot be relied upon. Sources: ARK Investment Management LLC, 2018

Global Mobile Transactions
($ trillions)

2014 2016 2018 2020 2022
$1.1 T $9.5 T $26 T $41 T $55 T

China could account for 80% of global mobile transactions in 2022, down from 92% in 2018, but still dominant.
Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of Digital Wallets, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to Digital Wallets, such as:

• Internet Company Risk
• Software Industry Risk

Internet Company Risk. Many Internet-related companies have incurred large losses since their inception and may continue to incur large losses in the hope of capturing market share and generating future revenues. Accordingly, many such companies expect to incur significant operating losses for the foreseeable future, and may never be profitable. The markets in which many Internet companies compete face rapidly evolving industry standards, frequent new service and product announcements, introductions and enhancements, and changing customer demands. The failure of an Internet company to adapt to such changes could have a material adverse effect on the company’s business. Additionally, the widespread adoption of new Internet, networking, telecommunications technologies, or other technological changes could require substantial expenditures by an Internet company to modify or adapt its services or infrastructure, which could have a material adverse effect on an Internet company’s business.

Software Industry Risk. The software industry can be significantly affected by intense competition, aggressive pricing, technological innovations, and product obsolescence. Companies in the software industry are subject to significant competitive pressures, such as aggressive pricing, new market entrants, competition for market share, short product cycles due to an accelerated rate of technological developments and the potential for limited earnings and/or falling profit margins. These companies also face the risks that new services, equipment or technologies will not be accepted by consumers and businesses or will become rapidly obsolete. These factors can affect the profitability of these companies and, as a result, the value of their securities. Also, patent protection is integral to the success of many companies in this industry, and profitability can be affected materially by, among other things, the cost of obtaining (or failing to obtain) patent approvals, the cost of litigating patent infringement and the loss of patent protection for products (which significantly increases pricing pressures and can materially reduce profitability with respect to such products). In addition, many software companies have limited operating histories. Prices of these companies’ securities historically have been more volatile than other securities, especially over the short term.
Throughout history, we have had to rely on trusted intermediaries to store and transfer value. With the launch of Bitcoin, Satoshi Nakamoto proposed an alternative financial system, one decentralized and free from top-down control.

ARK believes that cryptocurrencies have the potential to shift the course of monetary history and eliminate inefficiencies.
We Are Witnessing the Rise of an Alternative Financial System

**BARTER**
In early civilization, trade occurred in the form of barter.
Subject to the coincidence of wants, barter limited trade's scale and efficiency.

**GOLD**
Over time, collectibles emerged as widespread stores of value.
In the 19th century, a single store of value – gold – emerged.

**FIAT**
Given gold's intrinsic limitations as a means of exchange, the state monopolized the issuance of money, undermining its function as a store of value.

**BITCOIN**
In 2008, Satoshi Nakamoto proposed an alternative financial system governed by decentralized agents such as developers, miners, and users.
With the launch of Bitcoin, value can be stored and transferred in a permissionless and decentralized manner.

Bitcoin Launched the “Blockchain” Movement

- **Bitcoin** — with an uppercase B — refers to the software that facilitates the transfer and custody of **bitcoin** — with a lowercase b — the cryptocurrency.

- Bitcoin’s blockchain is a distributed digital ledger and database that records the flow of its native currency, bitcoin, and provides the foundation for **cryptonetworks**, the networks powering cryptocurrencies.

**Bitcoin’s Blockchain**

**Distributed**

Any computer can access Bitcoin’s blockchain, including the records of every transaction.

**Cryptographic**

Every transaction recorded must be verified cryptographically. Cryptography allows computers building Bitcoin’s blockchain to collaborate in an automated system of mathematical trust.

**Immutable**

An immutable database means Bitcoin’s blockchain is append-only. That is, information can be added but not deleted over time. Once confirmed, the information in Bitcoin’s blockchain cannot be erased.

**Secure**

Computers (aka miners) compete to solve cryptographic puzzles allowing them to add a block of transactions to the blockchain. Miners are rewarded for creating a new block either with newly minted bitcoin or fees from verifying transactions. This competition ensures Bitcoin blockchain’s security.
Assurance Is Key to Money

• Fiat currencies and the assurance they provide depend on the jurisdictions that issue them.
• Cryptonetworks such as Bitcoin provide assurance without relying on intermediaries.

<table>

Bitcoin Should Continue to Scale Thanks to Technological Breakthroughs

The Lightning Network is a second layer payment protocol with multi-directional channels, enabling fast and ‘fee-less’ transactions.

**Nodes:** A network participant with one or more open Lightning channels.

**Channels:** A communication channel that allows two parties to exchange payments rapidly on the Lightning Network.

**BTC Capacity:** Cumulative amount of bitcoin across all Lightning Network channels.

Sources: ARK Investment Management LLC, 2018 | Data from: bitcoinvisuals.com/lightning
Infrastructure Will Reinforce Bitcoin’s Layered Architecture

1. Casa: personal key security system for Bitcoin, Ethereum, Litecoin, and more. Multi-signature key service with hardware wallets.

2. Bakkt: an open, seamless global network to enable purchases, sales, storage, and ecommerce simply, safely, and efficiently.

3. Lightning Labs: an open protocol layer that leverages the power of blockchains and smart contracts to make cheap, fast, private transactions.

4. TxTenna: an app that enables off-grid broadcasts of Bitcoin transactions from Samourai Wallet.

5. CoinJoin: a decentralized method of combining multiple bitcoin payments from multiple spenders into a single transaction, making it difficult for outside parties to determine which spender paid which recipient or recipients.

Source: ARK Investment Management LLC, 2018
“Bitcoinization” is Impacting Economies

“Bitcoinization” is defined as a Bitcoin-induced currency demonetization. With hyperinflation in emerging markets like Venezuela, Iran, and Zimbabwe, the demand for cryptocurrencies could increase suddenly and significantly.

How Cryptocurrencies Could Emerge Quickly in Emerging Markets

1. Inflation causes loss of confidence in monetary authorities
2. Middle class converts savings to crypto
3. Businesses demand crypto in lieu of fiat
4. Fiat velocity rises significantly
5. Inflation accelerates
6. Bond investors sell holdings in emerging markets
7. Crypto economy emerges
8. Banking services cannot custody new assets
9. Fiat denominated debt load increases

Source: ARK Investment Management LLC, 2018
Sizing the Opportunity

Emerging Markets Prone to Inflation Are Adopting Bitcoin.

As indicated by Google search trends and exchange volume statistics, demand for bitcoin in emerging markets is high and growing.

Source: ARK Investment Management LLC, 2018
Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of Cryptoassets, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to Cryptoassets, such as:

- Cryptocurrency Risk
- Cryptocurrency Tax Risk

Cryptocurrency Risk. Cryptocurrency (notably, bitcoin), often referred to as “virtual currency” or “digital currency,” operates as a decentralized, peer-to-peer financial exchange and value storage that is used like money. ARK’s investment products may have exposure to bitcoin, a cryptocurrency, indirectly through an investment in the Bitcoin Investment Trust (“GBTC”), a privately offered, open-end investment vehicle. Cryptocurrency operates without central authority or banks and is not back by any government. Even indirectly, cryptocurrencies (i.e., bitcoin) may experience very high volatility and related investment vehicles like GBTC may be affected by such volatility. As a result of holding cryptocurrency, regulated investment companies such as Exchange Traded Funds (“ETFs”) may also trade at a significant premium to NAV. Cryptocurrency is also not legal tender. Federal, state or foreign governments may restrict the use and exchange of cryptocurrency, and regulation in the U.S. is still developing. Cryptocurrency exchanges may stop operating or permanently shut down due to fraud, technical glitches, hackers or malware. Cryptocurrency Tax Risk. Many significant aspects of the U.S. federal income tax treatment of investments in bitcoin are uncertain and an investment in bitcoin may produce income that is not treated as qualifying income for purposes of the income test applicable to regulated investment companies, such as ETFs. GBTC is expected to be treated as a grantor trust for U.S. federal income tax purposes, and therefore an investment by ETFs in GBTC will generally be treated as a direct investment in bitcoin for such purposes. Additional information may be found in the “Taxes” section of an ETF’s disclosure documents such as the prospectus and/or SAI.
Battery Cost Tipping Points

Batteries have entered a virtuous cycle: cost of goods is falling, stimulating unit demand growth which, in turn, is pushing batteries further down the cost curve.

ARK is forecasting that electric vehicle sales will rise from roughly 1.3 million in 2018 to more than 26 million in 2023. As a result, battery costs should drop to a point where utility-scale energy storage becomes attractive, enabling a multitude of new applications.
Lithium-ion Battery Costs Are Dropping Relentlessly

- Commercialized and assumed to have reached maturity in the early 1990’s, batteries are experiencing faster cost declines than most analysts anticipated.

- As batteries decline in cost, they are passing critical unit economic tipping points, unleashing further demand.

- Electric Vehicles (EVs) will drive battery prices down to a point where they will become economic for utility-scale energy storage.

Forecasts are inherently limited and cannot be relied upon.

Battery Cost Declines Are Enabling New Applications

- Low cost energy storage is enabling electric vehicles, stationary energy storage, and form factor diversification.
- ARK's research focuses on Electric Vehicles and Utility Energy Storage as the main drivers of battery demand.

**Electric Vehicles**

In August Tesla's Model 3 became the top revenue grossing sedan in the U.S.¹

**Utility Energy Storage**

California's Public Utilities Commission approved more than 2 GWh of energy storage to replace natural gas plants.²

**Micromobility**

30% of vehicle trips in the US are fewer than two miles in distance.³

Sources:
3. ARK Investment Management LLC, 2018 Data from: NHTS
All Vehicles Are Likely to Run on Electric Drivetrains

• If all vehicles go electric, the annual demand for batteries should top 4,000 GWh, more than 20 times current production levels.
• EVs probably will be the most important determinant of battery demand, though their unit sales may not top those of electric scooters/bikes, and their battery packs will be smaller than those of electric semi trucks.

Forecasts are inherently limited and cannot be relied upon.
Sources: ARK Investment Management, 2018
Thanks to Battery Cost Declines, EVs Should be Cheaper Than Comparable Gas-Powered Cars by 2022

- Battery costs should continue to drop, pushing EV prices below gas-powered vehicles in the early 2020s.
- In 2025 EVs should be competitive with gas powered cars at every price point, unleashing tremendous demand.

Forecasts are inherently limited and cannot be relied upon.
Source: ARK Investment Management LLC, 2018  |  ARK’s expectation for EV MSRP (Manufacturer’s Suggested Retail Price) parity is largely based on decreasing lithium-ion battery costs. Other factors could influence MSRP. The MSRP prices shown do not include any government subsidies.
ARK Forecasts That EV Sales Will Top 26 Million Globally in 2023.

Sources:
- EIA
- Bloomberg New Energy Finance
- ARK Invest

Forecasts are inherently limited and cannot be relied upon.
Utility-Scale Energy Storage Should Become Competitive

- Energy storage already is competitive with newly built natural gas plants.
- As battery costs decline, energy storage will become competitive with “peaker” plants and other underutilized generators.
- Building and operating new utility-scale energy storage will be more cost-effective than operating underutilized plants.

Utility-Scale Energy Storage is Approaching a Tipping Point

Sizing the Opportunity

- ARK’s research shows that, at $150/kWh, utility energy storage should become competitive with underutilized plants.
- Assuming batteries cycle daily, roughly 5 billion kWh of energy storage could replace electricity generated from underutilized plants.

Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of Battery Technology noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to Battery Technology, such as:

- Industrials Sector Risk
- Information Technology Sector Risk

**Industrials Sector Risk.** The industrials sector includes companies engaged in the aerospace and defense industry, electrical engineering, machinery, and professional services. Companies in the industrials sector may be adversely affected by changes in government regulation, world events and economic conditions. In addition, companies in the industrials sector may be adversely affected by environmental damages, product liability claims and exchange rates. Aerospace and Defense Company Risk. Companies in the aerospace and defense industry rely to a large extent on U.S. (and other) Government demand for their products and services and may be significantly affected by changes in government regulations and spending, as well as economic conditions and industry consolidation. Professional Services Company Risk. Professional services companies may be materially impacted by economic conditions and related fluctuations in client demand for marketing, business, technology and other consulting services. Professional services companies’ success depends in large part on attracting and retaining key employees and a failure to do so could adversely affect a company’s business. There are relatively few barriers to entry into the professional services market, and new competitors could readily seek to compete in one or more market segments, which could adversely affect a professional services company’s operating results through pricing pressure and loss of market share. Information Technology Sector Risk. The information technology sector includes companies engaged in internet software and services, technology hardware and storage peripherals, electronic equipment instruments and components, and semiconductors and semiconductor equipment. Information technology companies face intense competition, both domestically and internationally, which may have an adverse effect on profit margins. These companies may have limited product lines, markets, financial resources or personnel. The products of information technology companies may face rapid product obsolescence due to technological developments and frequent new product introduction, unpredictable changes in growth rates and competition for the services of qualified personnel. Failure to introduce new products, develop and maintain a loyal customer base, or achieve general market acceptance for their products could have a material adverse effect on a company’s business. Companies in the information technology sector are heavily dependent on intellectual property and the loss of patent, copyright and trademark protections may adversely affect the profitability of these companies.
ARK expects fully autonomous vehicles to be available commercially before 2020, enabling the rise and rapid growth of autonomous taxi networks. These networks should decrease the cost and inconvenience of point-to-point travel.

ARK believes that autonomous taxi networks represent one of the most important investment opportunities in public equity markets.
The Future of Driving Is Autonomous

ARK identifies four milestones in autonomous travel:

- Autonomous driving technology is ready today and should reach consumers in the next 1-2 years.
- Autonomous travel should be inexpensive, driving widespread adoption.
- Autonomous travel should supercharge app-based ride hailing.
- Autonomous taxis will not involve human drivers but, in rare instances, probably will be assisted by remote human operators.

Source: ARK Investment Management LLC, 2018
Transportation Should Become More Affordable

- The cost to own and operate a personal car has not changed since the Model T rolled off the first assembly line.
- ARK estimates that, at scale, autonomous taxis will cost consumers $0.26 cents per mile, spurring widespread adoption.

Note that ARK had estimated previously that an autonomous taxi could price at $0.35 per mile. We have refined our estimates and believe that autonomous taxis could be even cheaper, at only $0.26 per mile due to remote operator costs and discount rates.

Forecasts are inherently limited and cannot be relied upon.
Sources: ARK Investment Management LLC, 2018; Morton Salt Company Records, American Automobile Association (AAA)
Autonomous Driving Is An Extremely Challenging Problem to Solve

Fully autonomous driving (Level 5) is not ready for prime time yet, but ARK believes that Level 4 – in which a car drives itself most of the time with the exception of rare circumstances or in severe weather conditions – is ready for prime time.

Source: Variety of news sources in order:
Travel Could Go Autonomous Sooner Than Most Expect

ARK’s autonomous taxi adoption forecast is conservative, given the rollout plans of Waymo, GM, and Tesla.

**US Autonomous Taxi Adoption as a Percentage of Miles Traveled**

- If Waymo and GM execute on their commercialization plans in 2018 and 2019, each platform could reach our estimates for the entire US by 2020.
- Combined, the US adoption curve would be one year ahead of our estimates.

*If Tesla's fleet becomes autonomous, and all eligible vehicles join the Tesla Network, US adoption could hit 8% in 2020.*

Source: ARK Investment Management LLC, 2018 | *Assumes all eligible vehicles join the network.
Autonomous Taxis Will Cause More Congestion, But Will Lower Car Sales

- ARK expects global vehicle miles traveled to increase two- to three-fold during the next 15 years, as autonomous costs drop.
- At the same time, auto sales should be flat to down, thanks to the higher utilization of autonomous taxis.

**Global Vehicle Miles Traveled**

Autonomous Taxis Should Curtail Both Oil Demand and Insurance Premiums

Because of electric vehicle and autonomous taxi adoption, oil demand could peak next year and, within five years, could drop by roughly 10%, or 10 Mb/d, relative to expectations.

By 2030, annual insurance premiums could fall by 50-60% to $100 billion, thanks to the increased safety of autonomous technology and early adoption by young drivers who pay the highest rates today.

Forecasts are inherently limited and cannot be relied upon.
Autonomous Taxi Revenues Could Reach $8 Trillion in 2035.

Autonomous taxis should expand the market for personal point-to-point travel.

Global Spending on Personal Vehicle Travel (Trillions)

- In urban areas, manually driven miles should convert to autonomous miles.
- Average cost per mile traveled should drop, while total miles driven increase.
- Consequently, the market for vehicle manufacturers and suppliers will consolidate.

Forecasts are inherently limited and cannot be relied upon.
Source: ARK Investment Management LLC, 2018
ARK Believes That the Autonomous Taxi Opportunity Should Be Valued at $2 Trillion Dollars Today and $7 Trillion by 2028.

By 2028, the market cap of autonomous taxi platforms could exceed that of today’s energy sector.

Forecasts are inherently limited and cannot be relied upon.

Companies in the information technology sector are heavily dependent on intellectual property and the loss of patent, copyright and trademark protections may adversely affect the profitability of these companies.
Next Generation DNA Sequencing

Next-generation DNA sequencing is the driving force behind the genomic revolution. DNA sequencing costs are dropping dramatically. Since 2003 the cost to sequence a whole human genome has dropped from nearly $3 billion to less than $1,000, leveraging advances in biochemistry and computation.

ARK believes that as costs continue to drop, sequencing could become the clinical standard of care, introducing more science and knowledge to decision-making in health, agriculture, disease, and drug discovery.
Sequencing the Human Genome: A Retrospective

1953 DNA Structure
Watson and Crick propose the double-helical model of human DNA at Cambridge University.

1980 Sanger Sequencing
Frederick Sanger is awarded the Nobel Prize for developing a method to sequence DNA rapidly and accurately.

2003 Human Genome Project
NIH and Craig Venter sequence the first whole human genome.

2009 Next Generation Sequencing ("NGS")
Solexa, now owned by Illumina, commercializes high-throughput, high-accuracy DNA sequencing.

2014 $1,000 Genome
Illumina reduces the cost for whole human genome sequencing to less than $1,000 (USD).

2018 ILMN Acquires PACB
Illumina and "PacBio" join forces, offering a comprehensive view of the genome.

2020 Outlook
AI-based bioinformatics tools and long-read sequencing cost declines could power NGS clinical adoption in the early 2020's.

Forecasts are inherently limited and cannot be relied upon.

NGS Has Turbocharged the Progress of DNA Sequencing

**Next Generation Sequencing ("NGS")**

NGS is a high-speed, high-throughput methodology to detect the base pair sequence of DNA and RNA samples that combines novel biochemistry as well as optical and computing technologies.

ARK believes that innovation platforms like DNA sequencing:

**Cause Rapid Cost Declines**

NGS has cut sequencing costs to under $1,000 per whole human genome, creating new therapeutic and diagnostic market opportunities.

**Cut Across Sectors and Geographies**

Lower costs have enabled NGS research and commercialization in sectors ranging from healthcare to agriculture.

**Spawn Further Innovation**

NGS instruments have spurred advancements in sample prep, polygenic risk scoring, neural networks, and new gene editing technologies.

---

The Cost of DNA Sequencing Is Declining at a Rapid Rate

ARK believes that NGS is following Wright's Law—calculating unit cost declines for every cumulative doubling in units produced.\(^1\) In 2009, projections of the cost in the early 2020's to sequence a whole human genome were $1,000 based on Moore's Law, 10x higher than that predicted by Wright's Law.\(^2\)

### Cost Decline Comparison: Moore's Law vs. Wright's Law

- **Historical Cost**
- **Prediction (Wright's Law)**

Forecasts are inherently limited and cannot be relied upon.

\(^1\) ARK Investment Management LLC, 2018

As Costs Decline, the Demand For Whole Human DNA Sequencing Is Taking Off

ARK believes that the number of whole human genomes sequenced since 2003 should increase 50-fold from 2 million today to 100 million in the early 2020’s as NGS expands into new clinical, diagnostic, and agricultural markets.¹,²

Forecasts are inherently limited and cannot be relied upon.

² ARK Investment Management LLC, 2018
DNA Sequencing Falls Into Two Categories

NGS falls into two categories:

**Short Read NGS Instruments:**
- Fragment DNA into millions of small sections.
- Rely on quicker, cheaper, powerful computational algorithms to reassemble genomes digitally.
- Cannot detect subtle mutations unique to cancer and rare disease.

**Long Read NGS Instruments:**
- Fragment DNA into fewer, larger sections.
- Rely on longer, expensive biochemistry workflows.
- Can detect subtle mutations found within oncology and rare disease.

Source: ARK Investment Management LLC, 2018
NGS Is Entering the Clinic

Declining costs for long and short read sequencing are enabling a wide array of clinical applications for NGS, including:

**Hereditary Disease Screening**

**Metagenomics**

- 20% of global deaths are caused by pathogens like bacteria, viruses, and parasites.¹
- NGS can scan ALL of a patient’s genetic material, including infectious agents, quickly and precisely.²

**Polygenic Risk Scores (PRS)**

- NGS instruments can recognize patterns in DNA so that genetic experts can quantify a patient’s risk for cancer.
- Sophisticated neural networks are combining DNA and medical images to make PRSs more accurate.³

Sizing the Opportunity

NGS Revenues Could Scale From Roughly $4 Billion Today to $19 Billion in 2023.

As costs continue to decline, the number of whole human genomes sequenced should scale rapidly.

2018
* $3.8 Billion Revenue

2018 - 2023
Average Selling Price ↓ 10X
Number Genomes ↑ 50X

2023
** $19 Billion Revenue

* $1,900 Average Selling Price
2 Million Genomes Cumulatively

** $190 Average Selling Price
100 Million Genomes Cumulatively

Forecasts are inherently limited and cannot be relied upon.

Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of DNA Sequencing, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to DNA Sequencing, such as:

- Health Care Sector Risk
- Biotechnology Company Risk
- Pharmaceutical Company Risk

**Health Care Sector Risk.** The health care sector may be affected by government regulations and government health care programs, restrictions on government reimbursement for medical expenses, increases or decreases in the cost of medical products and services and product liability claims, among other factors. Many health care companies are: (i) heavily dependent on patent protection and intellectual property rights and the expiration of a patent may adversely affect their profitability; (ii) subject to extensive litigation based on product liability and similar claims; and (iii) subject to competitive forces that may make it difficult to raise prices and, in fact, may result in price discounting. Many health care products and services may be subject to regulatory approvals. The process of obtaining such approvals may be long and costly, and delays or failure to receive such approvals may negatively impact the business of such companies. Additional or more stringent laws and regulations enacted in the future could have a material adverse effect on such companies in the health care sector. In addition, issuers in the health care sector include issuers having their principal activities in the biotechnology industry, medical laboratories and research, drug laboratories and research and drug manufacturers, which have the additional risks described below. **Biotechnology Company Risk.** A biotechnology company’s valuation can often be based largely on the potential or actual performance of a limited number of products and can accordingly be greatly affected if one of its products proves, among other things, unsafe, ineffective or unprofitable. Biotechnology companies are subject to regulation by, and the restrictions of, the U.S. Food and Drug Administration, the U.S. Environmental Protection Agency, state and local governments, and foreign regulatory authorities. **Pharmaceutical Company Risk.** Companies in the pharmaceutical industry can be significantly affected by, among other things, government approval of products and services, government regulation and reimbursement rates, product liability claims, patent expirations and protection and intense competition.
CRISPR is a powerful DNA editing tool that should be able to delete, replace or repair genes easily, inexpensively, and precisely.

We believe CRISPR is the most promising way to cure diseases – from sickle cell anemia to cystic fibrosis to pediatric blindness to cancer. CRISPR genome-editing should shift the health care system from treating symptoms to curing disease.
CRISPR Gene-Editing Will Revolutionize Genomic Medicine

- CRISPR enables cheap and rapid “write” capabilities to correct defects and cure diseases.
- Genetic defects in the human code cause many diseases including cancer, heart disease, diabetes, cystic fibrosis, and Alzheimer’s.

**CRISPR: Clustered Regularly Interspaced Short Palindromic Repeats**

Sizing the Opportunity

CRISPR Should Address All Monogenic Diseases, Potentially Generating $75 Billion in Global Revenue Per Year.

Only 5% of 10,000 monogenic diseases, conditions caused by an error in a single gene, respond to any treatment today.

- 1 in 100 live human births results in a monogenic disease.\(^1\)
- CRISPR entered human trials in 2018
- If CRISPR were to address individuals already living with monogenic diseases, its one time global addressable market would be $2 trillion.

Forecasts are inherently limited and cannot be relied upon.
Source: ARK Investment Management LLC, 2018

Forecasts are inherently limited and cannot be relied upon. | Sources: “Cost of Diabetes Hits 825 Billion Dollars a Year.” Harvard T.H. Chan School of Public Health, 2016, https://arkinv.st/2AzlGfG
CRISPR Is Enabling Next-Generation CAR-T Targeting Cancer

- Chimeric Antigen Receptor T-cell (CAR-T) therapy is a novel immunotherapy that modifies a patient’s own T-cells to target and kill malignant cells while keeping healthy cells intact.

- In 2017, the FDA approved first-generation CAR-T immunotherapies after trials showed high complete remission rates in liquid tumors. Based on life-years gained, CAR-T therapy is cheaper than other approved cancer immunotherapies.
Sizing the Opportunity

Globally, CAR-T Cancer Immunotherapy Could Generate Revenues of $433 Billion Per Year in Revenues, With Royalties Payable to CRISPR Companies.

CRISPR should enhance the safety and efficacy of next generation CAR-T therapies.

- Early stage cancer and solid tumor indications are the biggest value drivers for CAR-T therapy.
- In the past year, CRISPR has increased the probability that CAR-T will be successful in addressing solid state tumors.

Global Addressable Market Estimate for CAR-T*

- Liquid Tumors: Early Stage
- Liquid Tumors: Late Stage
- Solid Tumors: Early Stage
- Solid Tumors: Late Stage

Companies in the pharmaceutical industry can be significantly affected by, among other things, government approval of products and services, government regulation and reimbursement rates, product liability claims, patent expirations and protection and intense competition.
Collaborative Robots

Robots are increasing their footprint and creating jobs. Collaborative robots (cobots) are designed to work alongside humans and are retrained easily, adding to labor productivity.

Collaborative robot costs are lower than those of traditional industrial robots and leverage the power of deep learning. ARK believes that all robots will be collaborative in the long run.
Traditional Industrial Robots vs. Collaborative Robots

**TRADITIONAL ROBOTS: SOFTWARE**

*Industrial robots* are defined by ISO 8373:2012 as an automatically controlled, reprogrammable, and multipurpose manipulator, programmable in three or more axes which can be either fixed in place or mobile.

**COBOTS: DEEP LEARNING**

*A collaborative robot* ("cobot") is a robot designed to share a workspace with humans with whom they may have direct physical interaction. They are a subset of industrial robots.

Sources: ARK Investment Management LLC, 2018
Robot Costs Are Dropping

As industrial robot costs continue to decline, their addressable market will expand.

Forecasts are inherently limited and cannot be relied upon.
Sources: ARK Investment Management LLC, 2018.
Robot Demand Is Responding to Lower Costs

As industrial robots have declined in cost, demand growth has accelerated.

Industrial Robot Price Elasticity of Demand

- 1996-2002
- 2002-2010
- 2009
- 2010-2015
- 2016-2017

Forecasts are inherently limited and cannot be relied upon.

- Industrials Sector Risk
- Information Technology Sector Risk

**Industrials Sector Risk.** The industrials sector includes companies engaged in the aerospace and defense industry, electrical engineering, machinery, and professional services. Companies in the industrials sector may be adversely affected by changes in government regulation, world events and economic conditions. In addition, companies in the industrials sector may be adversely affected by environmental damages, product liability claims and exchange rates. **Aerospace and Defense Company Risk.** Companies in the aerospace and defense industry rely to a large extent on U.S. (and other) Government demand for their products and services and may be significantly affected by changes in government regulations and spending, as well as economic conditions and industry consolidation. **Professional Services Company Risk.** Professional services companies may be materially impacted by economic conditions and related fluctuations in client demand for marketing, business, technology and other consulting services. Professional services companies' success depends in large part on attracting and retaining key employees and a failure to do so could adversely affect a company's business. There are relatively few barriers to entry into the professional services market, and new competitors could readily seek to compete in one or more market segments, which could adversely affect a professional services company's operating results through pricing pressure and loss of market share. **Information Technology Sector Risk.** The information technology sector includes companies engaged in internet software and services, technology hardware and storage peripherals, electronic equipment instruments and components, and semiconductors and semiconductor equipment. Information technology companies face intense competition, both domestically and internationally, which may have an adverse effect on profit margins. These companies may have limited product lines, markets, financial resources or personnel. The products of information technology companies may face rapid product obsolescence due to technological developments and frequent new product introduction, unpredictable changes in growth rates and competition for the services of qualified personnel. Failure to introduce new products, develop and maintain a loyal customer base, or achieve general market acceptance for their products could have a material adverse effect on a company's business. Companies in the information technology sector are heavily dependent on intellectual property and the loss of patent, copyright and trademark protections may adversely affect the profitability of these companies.
3D Printing for End-Use Parts

3D printing is a form of additive manufacturing that builds objects layer-by-layer instead of removing material from a larger block or using a mold.

As a result, 3D printing collapses the time between design and production, shifts power to designers, and creates products with both radically new architectures and less waste, at a fraction of the cost of traditional manufacturing.

ARK believes that 3D printing will revolutionize manufacturing.
ARK separates 3D printing’s addressable market into three categories — “End-Use Parts” the most promising.

1. PROTOTYPES
3D printing creates test parts quickly and inexpensively.

2. MOLDS AND TOOLS
3D printing produces parts which streamline the manufacturing process.

3. END-USE PARTS
3D printing manufactures parts for finished products.

3D Printing Offers a Range of Benefits

- Shortens design-to-production time
- Shifts power to designers
- Creates products with less waste
- Enables radically new architectures
- Reduces the cost of manufacturing significantly
- Creates machine learning-generated architectures

These structural units support the same weight. The 3D printed part on the right, however, weighs 75% less and is 50% the size of the traditional manufacturing part on the far left.

ARK’s research shows that 3D printing for end use parts is the next frontier.

### 3D Printing Market Potential and Its Current Penetration

<table>
<thead>

3D Printing Is Penetrating the Aerospace & Aviation Industry

ARK estimates that 3D printing has penetrated only 1% of the addressable market for aircraft. Given 10-20% gross margins, aerospace companies have significant incentives to adopt 3D printing.

**CASE STUDY 1: Advanced Turboprop Engine (ATP)**
- Number of parts dropped from 855 to just 12
- Fuel burn lowered 20%
- Weight reduced by 5%
- Test schedules cut in half to 6 months

**CASE STUDY 2: GEnx Engine Metal Bracket**
- 20 components combined into one single piece
- Manufacturing waste reduced by 90%
- Weight reduced by 10%
- New part less expensive to produce

The End-Use Parts Market Should Grow Rapidly, Even in Space

3D PRINTING ON EARTH

- Cost declines in rockets, satellites, and antennas are leading to a new space age.

- Lockheed Martin estimates that it will be able to produce 3D printed satellites twice as fast at half of the cost.¹

3D PRINTING IN SPACE

- Today, the cost to launch an object into space is $10,000 per payload pound.

- Eventually, parts will be printed in-orbit, either with materials brought from earth or mined from Mars.

Risk and Disclosure

Please note, companies that ARK believes are capitalizing on disruptive innovation and developing technologies to displace older technologies or create new markets may not in fact do so and/or may face political or legal attacks from competitors, industry groups, or local and national governments.

ARK aims to educate investors and to size the potential opportunity of 3D Printing, noting that risks and uncertainties may impact our projections and research models. Investors should use the content presented for informational purposes only, and be aware of market risk, disruptive innovation risk, regulatory risk, and risks related to 3D Printing, such as:

- Industrials Sector Risk
- Machinery Industry Risk
- Software Industry Risk

Industrials Sector Risk. The industrials sector includes companies engaged in the aerospace and defense industry, electrical engineering, machinery, and professional services. Companies in the industrials sector may be adversely affected by changes in government regulation, world events and economic conditions. In addition, companies in the industrials sector may be adversely affected by environmental damages, product liability claims and exchange rates. Aerospace and Defense Company Risk. Companies in the aerospace and defense industry rely to a large extent on U.S. (and other) Government demand for their products and services and may be significantly affected by changes in government regulations and spending, as well as economic conditions and industry consolidation. Professional Services Company Risk. Professional services companies may be materially impacted by economic conditions and related fluctuations in client demand for marketing, business, technology and other consulting services. Professional services companies’ success depends in large part on attracting and retaining key employees and a failure to do so could adversely affect a company’s business. There are relatively few barriers to entry into the professional services market, and new competitors could readily seek to compete in one or more market segments, which could adversely affect a professional services company’s operating results through pricing pressure and loss of market share. Machinery Industry Risk. The machinery industry can be significantly affected by general economic trends, including employment, economic growth, and interest rates; changes in consumer sentiment and spending; overall capital spending levels, which are influenced by an individual company’s profitability and broader factors such as interest rates and foreign competition; commodity prices; technical obsolescence; labor relations legislation; government regulation and spending; import controls; and worldwide competition. Companies in this industry also can be adversely affected by liability for environmental damage, depletion of resources, and mandated expenditures for safety and pollution control. Software Industry Risk. The software industry can be significantly affected by intense competition, aggressive pricing, technological innovations, and product obsolescence. Companies in the software industry are subject to significant competitive pressures, such as aggressive pricing, new market entrants, competition for market share, short product cycles due to an accelerated rate of technological developments and the potential for limited earnings and/or falling profit margins. These companies also face the risks that new services, equipment or technologies will not be accepted by consumers and businesses or will become rapidly obsolete. These factors can affect the profitability of these companies and, as a result, the value of their securities. Also, patent protection is integral to the success of many companies in this industry, and profitability can be affected materially by, among other things, the cost of obtaining (or failing to obtain) patent approvals, the cost of litigating patent infringement and the loss of patent protection for products (which significantly increases pricing pressures and can materially reduce profitability with respect to such products). In addition, many software companies have limited operating histories. Prices of these companies’ securities historically have been more volatile than other securities, especially over the short term.
